Test Comments: Emergence was good at this location, and corn was uniform at early growth stages. June rains produced very tall plants with head high ear placement. Rainfall was limited during the reproductive growth stages, leading to smaller ears. Significant ear tip die-back was seen on most hybrids, and kernel size appeared smaller than normal. Stalk quality was failing rapidly and noted above.

† See last page for footnote information. Dark colored row identifies the check product found in early- and full-season tests. **Bold** yields are significantly above test average. **Italicized** brands exceed the grain moisture limit for this test. **GC** = grower comparison product, **ns** = not significantly different
