Test Comments: Tom stated that "like the trial field, any areas that retained excess spring rains stunted the hybrids' growth". In the test, plants in wet low areas had stunted growth and lacked crop canopy, allowing fall panicum to flourish and further rob yields. Water affected 1/3 to 1/2 of the test area. Highly variable results led to early-season test results rejection and 1 full-season test replication being discarded.

† See last page for footnote information. Dark colored row identifies the check product found in early- and full-season tests. **Bold** yields are significantly above test average. **Italicized** brands exceed the grain moisture limit for this test. **GC** = grower comparison product, **ns** = not significantly different
