Test Comments: This test was no-till planted late May into corn residue a few days before the surrounding field was planted. An extreme slug infestation consumed all plants in several plots while many other plots only had a 50% stand. After further evaluation, it was determined that the slug damage was not hybrid related but instead, dependant upon slug population in the field. This test was not harvested.

† See last page for abbreviation descriptions. Dark colored row identifies the check product found in early- and full-season tests. **Bold** yields are significantly above test average by LSD(0.10). **Italicized** brands exceed the grain moisture limit for this test. **ns** = column values not significantly different
