TEST COMMENTS:

This plot site was planted 17 days after Dru planted the surrounding field (his field averaged 67 bu/a). The later planting date exposed these beans to late season disease pressure, due to above average rains as the summer progressed. With a warmer and drier period from mid-August through early October, these later-planted soybeans lost their top-end yield potential. Yields were good, but not record shattering. The plants were above average in height, but the hot and dry weather of September limited seed size.
