TEST COMMENTS:

This long-standing location was planted on May 5th in ideal conditions. Limited rainfall after planting slowed initial emergence. Early June rainfall helped get things back on track, and stand counts were good, although some plants were slower to develop than others. July brought hot and dry conditions, but the corn held up well. Steady precipitation, including some heavy rainfall events, brought the season's total to 6 inches above the 10-year average. At harvest, minor stalk stress and mild tar spot were observed. Cobs appeared full and relatively high on the stalks. Despite the challenges this corn endured throughout the growing season, it performed very well!
